

The Galaxy–Dark Matter Connection

constraining cosmology & galaxy formation

Frank C. van den Bosch (MPIA)

Collaborators: Houjun Mo (UMass), Xiaohu Yang (SHAO)

Marcello Cacciato, Surhud More (MPIA)

Outline, Motivation & Techniques

Why study the Galaxy-Dark Matter Connection?

- To constrain the physics of **Galaxy Formation**
- To constrain **Cosmological Parameters**

Four Methods to Constrain Galaxy-Dark Matter Connection

- Group Catalogues
- Large Scale Structure
- Satellite Kinematics
- Galaxy-Galaxy Lensing

New Cosmological Constraints

- Precision cosmology using **non-linear** structure

The Conditional Luminosity Function

In order to parameterize the Halo Occupation Statistics we introduce the **Conditional Luminosity Function** (CLF), $\Phi(L|M)$, which is the direct link between the halo mass function $n(M)$ and the galaxy luminosity function $\Phi(L)$:

$$\Phi(L) = \int_0^\infty \Phi(L|M) n(M) dM$$

The CLF contains a wealth of information, such as:

- The average relation between **light** and **mass**:

$$\langle L \rangle(M) = \int_0^\infty \Phi(L|M) L dL$$

- The occupation numbers of galaxies:

$$\langle N \rangle(M) = \int_{L_{\min}}^\infty \Phi(L|M) dL$$

We constrain CLF using four different, independent techniques

Extra Material

The CLF Model

We split CLF in **central** and **satellite** components

$$\Phi(L|M)dL = \Phi_c(L|M)dL + \Phi_s(L|M)dL$$

- For **centrals** we adopt a log-normal distribution

$$\Phi_c(L|M)dL = \frac{1}{\sqrt{2\pi}\sigma_c} \exp\left[-\left(\frac{\ln(L/L_c)}{\sqrt{2}\sigma_c}\right)^2\right] \frac{dL}{L}$$

- For **satellites** we adopt a modified Schechter function

$$\Phi_s(L|M)dL = \frac{\Phi_s}{L_s} \left(\frac{L}{L_s}\right)^{\alpha_s} \exp[-(L/L_s)^2] dL$$

Note that L_c , L_s , σ_c , ϕ_s and α_s all depend on halo mass M

Free parameters are constrained by fitting data

Use **Monte-Carlo Markov Chain** to sample the posterior distribution of free parameters, and to put confidence levels on derived quantities

Satellite Kinematics: Mass Estimates

Using **virial equilibrium** and **spherical collapse model**:

$$\sigma^2 \propto \frac{GM}{R} \quad M \propto R^3 \quad \sigma \propto M^{1/3}$$

On average only ~ 2 satellites per central \rightarrow **stacking**

Unless $P(M|L_c)$ is a Dirac delta function, stacking means combining halos of different masses

Consequently, one has to distinguish two different weighting schemes:

Satellite Weighting: each satellite receives weight of one

$$\sigma_{sw}^2 = \frac{\int P(M|L_c) \langle N_{sat} \rangle_M \sigma_{sat}^2(M) dM}{\int P(M|L_c) \langle N_{sat} \rangle_M dM}$$

Host Weighting: each host receives weight of one

$$\sigma_{hw}^2 = \frac{\int P(M|L_c) \sigma_{sat}^2(M) dM}{\int P(M|L_c) dM}$$

Galaxy-Galaxy Lensing

Conclusions

Extra Material

Galaxy-Galaxy Lensing

The mass associated with galaxies lenses background galaxies

Lensing causes correlated ellipticities, the **tangential shear**, γ_t , which is related to the **excess surface density**, $\Delta\Sigma$, according to

$$\gamma_t(R) \Sigma_{\text{crit}} = \Delta\Sigma(R) = \bar{\Sigma}(< R) - \Sigma(R)$$

$\Sigma(R)$ is line-of-sight projection of **galaxy-matter cross correlation**:

$$\Sigma(R) = \bar{\rho} \int_0^{D_S} [1 + \xi_{g, \text{dm}}(r)] d\chi$$

Conclusions

Extra Material

How to interpret the signal?

Because of **stacking** the lensing signal is difficult to interpret

In order to model the data, what is required is:

$$P_{\text{cen}}(M|L) \quad P_{\text{sat}}(M|L) \quad f_{\text{sat}}(L)$$

These can all be computed from the **CLF**

Using $\Phi(L|M)$ constrained from **clustering data**, we can predict the **lensing signal** $\Delta\Sigma(R|L_1, L_2)$

Comparison with CLF Predictions

Cosmological Conclusions

Cosmological constraints obtained from **non-linear** structure (clustering + lensing + group catalogue) are in excellent agreement with **CMB** constraints

Current **(preliminary)** results suggest

$$\Omega_m = 0.21 \pm 0.01 \text{ (95\% CL)}$$
$$\sigma_8 = 0.73 \pm 0.03 \text{ (95\% CL)}$$

This technique is competitive with and complementary to **BAO, cosmic shear, SNIa and Ly α forest**

If anything, our results indicate that our model for structure formation is accurate on non-linear scales
